                                       The nucleic acid sequence was isolated from a human adult ciNA library using a swellfish ANO3 derived probe. The protein can be used for the development of drugs and diagnosis and treatment of various diseases.

The hPXR is used to identify: its specific modulators, and compounds that induce CYP3A4 expression (i.e. to identify drug interactions, since CYP3A4 is involved in many biotransformations of drugs). The modulators are potentially useful for: associating particular diseases and conditions with PXR and for treating such conditions. Antibodies raised against hPXR can be used for determination and purification of hPXR. The present sequence represents a DNA encoding the

                                                                                                                                                 Percent Similarity:
                                                                                                                                                                                                                                                                                                               malian immours, hyperprolliterative skin disorders or hyperthyroidism. Nucleic acid vectors encoding for expression of a VDRK polypeptide can be used for treating metabolic, prolliterative or inflammatory conditions, by introducing them into a mammal. The introduced nucleic acid is then capable of transforming a cell in vio and then polypeptide is expressed. A substance affecting VDRK signal transduction, such as an agonist or antagonist can be used for the manufacture of a medicament for treating metabolic, prolliterative or inflammatory condition.

N.H. The specification specifically claims the VDRK mucleic acid and polypeptide sequences given in figures 1, 4, 7 and 8, but no figures

The nNR7 and nNR7-1 proteins are useful in the identification of downstream target genes and ligands regulating its activity. The nuclear receptor is involved in the regulation of in vivo cell proliferation and/or cell development. The nNR7 and nNk7-1 polynucleotides, expression vectors and host cells are useful for the

                                                                                                                                                                                                                                                                                         This invention describes the isolation of the novel human nuclear receptors nNR7 or nNR7-1. The nNR7 and nNR7-1 proteins are useful in the identification of downstream target genes and liquids requiation its activity. The nuclear receptor is involved in the requiation of in vivo cell proliferation and/or cell development. The nNR7 and nNR7-1 polynucleotides, expression vectors and host cells are useful for the recombinant production of the protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       by introducing them into a mammal. The introduced nucleic acid is then capable of transforming a cell in vivo and then polypeptide is expressed A substance affecting VMR stanal transduction, such as an agonist or antagonist can be used for the manufacture of a medicament for treating metabolic, proliferative or inflammatory condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            polypoptide. Human VDRR polypoptides and substances which affect VDRR signal transduction, can be used for treating metabolic, proliferative or inflammatory conditions when he was be used in the first form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          malign tumours, hyperproliterative skin disorders or hyperthyroidism.
Nucleic acid vectors encoding for expression of a VDRR polypeptide can
be used for treating metabolic, proliferative or inflammatory conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               480

an agonist is used where endogenous steroid levels are excessive (e.g. Cushing syndrome; virilism and hirsuitsm in women: polycystic ovarian disease; 11 beta-, 17- or 21-hydroxlase deficiency; 3 beta-hydroxysteroid dehydrogenase deficiency, or breast, colorectal or prostatic cancer), while antagonists are used where endogenous steroid levels are too low. Cells that express SXR are used to identify compounds likely to be involved in undesirable drug interactions. Antibodies specific for SXR are used in immunohistochemical testing for studying distribution/ expression density of SXR, also for diagnosis and therapeutically as
                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel nuclear receptor polypeptide, designated SXR (steroid and xenoblotic receptor). SXR (i) forms a heterodimer with retinoid X receptor (RXR), (ii) binds to a direct or inverted repeat response element motif based on the half-site ACTTCA, (iii) activates transcription through response elements present in steroid-inducible P450 genes, in response to a wide variety of natural and synthetic steroid.
                                                                                                                                                                                                       reduce steroid toxicity in subjects being treated with steroids, e.g. in cases of tuberculosis (treated with rifampin and related compounds), breast cancer (treated with tamoxifen, raloxifen etc.) or osteoporosis (treated with Vitamin K), or to slow metabolism of therapeutic steroids. Also, modulating endogenous SXR is used to treat disease, particularly
                                                                                                                                                                                                                                                                                                                                                                                       hormones and (iv) is prominently expressed in liver and intestine. SXR regulates expression of catabolic enzymes, in response to many difference regulates expression of catabolism. SXR is a broad specificity, low-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          retinoid X receptor; P450 gene; steroid hormone; steroid metabolism; phytoestrogen; calcium-channel blocker; steroid toxicity; tuberculosis; breast cancer; osteoporosis; Cushing syndrome; virilism; hirsutism;
                                                                                                                                                                                                                                                                                                                       circulation. (Ant)agonists of SXR are used to regulate metabolism of steroids particularly phytoestrogens or calcium-channel blockers, to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (AAR98521), a new member of the steroid receptor superfamily, characterised as being responsive to the presence of hydroxy, mercapto or amino benzoate(s) and as regulating the transcription of associated gene(s). It was identified in a screen to maternally.

The isoform differs from the normal receptor (VDR0), which is encoded by the present sequence, in having the vitamin D response element curtailed by 86 residues, and having an extra 19 residues inserted at the C-terminal of this element. It extra as a dominant negative receptor in the vitamin D signal

                         using insect host cells transformed with DNA coding for an animal (pret human, rat, porcine or avian) vitamin b receptor. The coding sequence is incorporated into a recombinant baculovirus vector for transformation of the insect host. The rat version of the coding sequence was published in Burmester et al., Proc.Natl. Acad.Sci USA 85:9499-9502 (1988).
                                                                                                                                                                                           Recombinant product of 1,25-dichydroxy-vitamin by receptor using expression system comprising insect cell host and recombinant virus contg. foreign DNA

The polynucleotides are useful in methods for detecting agonist and /or antagonist compound of a VDR isotorm. An increase or decrease in activity of the receptor may be detected by measuring changes in interactions with known cofactors (e.g. sRC-1, GRTP-1 and TETID) or unknown cofactors (e.g. through use of the dual hybrid system). The polynucleotides shown in AAX4787, AAX4791 and AAX4792 (corresponding polynucleotides shown in AAX4787, AAX4791 and AAX4792 (corresponding to hVDM exon sequences) may be useful as probes for the detection of VDM variant transcripts and for assessing cell or tissue specific expression of variant transcripts. The present sequence represents the nucleotide 697 CCAGCTTCTCCAATCTGGATCTGAGTGAAGAAGATTCAGAT..... 208 erlædlysValSerlædInLeuArgGlyGluAspGlySerValTrpAsn 224 171 snPheArgLeuProGlyVallauSerSerGly......cysGlu 183 4.56 406 104 306 159 CCCCGGATCTGTGGGGGTGTGTGGAGACCGAGCCACTGGCTTTCACTTCAA 647 CTCCTCTCACATCACTCTATCACCTCTTCAGACATGATGGACTCGT 603 AGGCCCAACTECCAGACACACTCCCAGC.....TTCTCTCTGGGGACTCCTC 646 184 LeuProGluSerLeuGlnAlaProSerArqGluGluAlaAlaLysTrpSe 200 553 ACTICOUNCERCACTICOTGANICATGATGATGAGGAGGAACCTICC 138 LeuclyValGlnGlyLeuThrGluGlnGlnArqMetMet1leArgGluLe 154 121 rqArqAlaLeuHehysArqbyshysSerGluArqThrGlyThrGluPro 137 556 CATCGGCATGATGAAGGAGTTCATTCTGACAGATGAGGAAGTGCAGAGGA 405 Sequence 1382 BP; 310 A; 409 C; 379 G; 284 T; 0 other; sequence of hVDR gene transcript 9. 209 FGCTATGACCTGTGAAGGCTGCAAAGGCTTCTTCAGGCGAAGCATGAAGC 88 71 rqAsnAlaArqLeuArqCysProPheArqLysGlyAlaCysGlulleThr 87 54 nValMetThrCysGluGlyCysLysGlyPhePheArgArgAlaMetLysA 71 uSerGlyMetLysLysGluMetileMetSerAspGluAlaValGluGluA 121 ArqLysThrArqArqGInCysGInAlaCysArqLouArqLysCysLeuGl 104 GGAAGGCACTATTCACCTGCCCCTTC...AACGGGGACTGCCGCATCACC CTGCGGCCCAAG...,CTGTCTGAGGAGCAGCAGCGCATCATTGCCATACT ACCCCCACATGATTCCTGAAGCGGAAGGAGGAGGAGGGCTTTGAAGGACACT 455 AAGGACAACGGACGCCACTGCCAGGCCTGCCGGCTCAAACGCTGTGTGGA Quality: 750.00 Percent Identity: 40.291 Length: Gabs: 355
